

Flush Air Vent

There is a wide assortment of air vents on the global marine market today, but there are no solutions that are totally flushed. With the trend for boat design and construction clearly moving towards sleek and completely flushed decks and hulls, the Rutgerson team started investigating how a flushed solution could be achieved.

The result is a unique product that is completely flushed to the hatch but its black colour and round shape as well as the seamless connection between the opening part and receptacle, makes the product very discreet and almost invisible from afar.

The Flush Air Vent has been designed to capture as much air as possible while keeping out water, such as waves and rain. There are no clasps, knobs or rotating movements needed to open or close the air vent. When open, the venting unit sticks up over the otherwise flat surface. When closed, the ventilating unit does not exceed the depth of the inner handles. This air vent can be closed and made water-tight from the deck, removing the need to go down into the cabin to close it. Imagine a situation where a boat is out sailing and the boatowner has forgotten to close the air vents before leaving shore. The crew can easily see that the air vents are open from the cockpit and just walk over and close it with his/her foot.

We have submitted our patent application with reference number SE2351096-9.

Like all other products from Rutgerson, the Flushed Air Vent is designed and produced in Marstrand, Sweden.

This unique innovation is available for delivery in April 2024.

Core benefits

- Flushed and streamlined design
- Visible from outside when open
- Possible to close from the outside
- Made in Sweden
